

## **INSPECTION, MAINTENANCE, AND CLEANING OF FACADE STRUCTURES**

A ventilated facade provides the ultimate thermal, acoustic insulation, and moisture regulation. Therefore, building owners are well advised to regularly carry out inspections, maintenance, and cleaning to prevent problems.

If a ventilated facade structure shows contamination or defects, it is important to take action quickly to prevent further damage.

The investment in inspection, maintenance, and cleaning pays off doubly. Good maintenance, in addition to a well-groomed appearance, translates into a quality guarantee by timely identifying and preventing (consequential) damage, and maintaining the (rental) value of the property. As always, prevention is better than cure. Fortunately, more and more building owners are aware of this.
