

BONDED CLADDING APPLIED WORLDWIDE

TWEHA operates all over the world. Our distribution network, with support from TWEHA headquarters, offers expert advice in facade design and engineering and sustainable application of the TWEHA adhesive systems. Thanks to our know-how, research and support, the application of bonded façade elements is now widely accepted in most European countries. The USA, Canada and the Middle East are still emerging markets.

Looking at the European market, it is striking that Dutch construction is generally seen as innovative everywhere. But Germany and France are exceptions! In these relatively conservative countries, protectionism and bureaucracy stand in the way of important developments. Local governments and interest groups are slow to act and changes are slow to be implemented. French and German façade builders look with envy at countries across the border, where TWEHA adhesive systems are used with great enthusiasm.
