

BONDING CLADDING AT LOW TEMPERATURES

Is it impossible to bond façade panels in the winter? This barrier only applies to adhesive systems that require a primer!

Tweha has been providing the solution for bonding at lower temperatures for years. Where other systems fail due to the use of primers, which simply do not function at lower temperatures, Tweha products do not limit you because no primers are required!

The absence of a primer therefore makes it possible to process the adhesive system at low temperatures (<5 °C).

Recent research by one of our relations in Austria has shown that the bond with the TWEHA products works well at -15 °C (5 °F)!
