

‘JUST IN CASE... LET’S APPLY AN EXTRA FASTENING POINT...’

Facades are designed and executed with the aim of realizing a specific and intended expression or image. An expression that can be properly nullified by pollution and unfortunately bonded facades often pollute unnecessarily if unknowingly decided to use an extra hook or screw.

Luckily it is not as common as it once was because it is considered as unnecessary and also in conflict with the contemporary safety philosophy as internationally used in static regulations. There’s a reason why people use the term ‘panic hook’ when such a discussion heat up due to ignorance.

Given the above, it is important that the intended appearance of your business premises is maintained. After all, it is the gateway to your company or product.

Therefore it’s necessary to design and build your façade in such a way that atmospheric pollution, acid rain and exhaust fumes cannot affect the image that your façade must project.

Consistent with poor detailing pollution will lead to an impression of sloppy and deterioration.
