

SUSTAINABLE ADHESION

Façade cladding, and in particular the bonding thereof, is an area of expertise. The government makes high demands on the quality of the adhesive. Logical, because sustainability comes first. At TWEHA, we have developed endlessly and tested the durable adhesion on hundreds of panel types to finally arrive at an adhesive bond that is sustainable and easy to apply.

Adhesion test according to national and international guidelines and standards and our own test methods ensure perfect adhesion of our products to the substrates used in any project. Detailed project testing is carried out according to a reliable and practicable system, which form a solid basis for successful project execution.

The results are provided in a report. We use the results obtained to make recommendations on cladding materials and application method to be used.

Please have a look at [our survey of tested and approved cladding materials](#).
