

THE MOST NOTABLE TRENDS IN FAÇADE CONSTRUCTION

Developments in façade construction are rapid. We would like to share two of the most important trends with you.

Modular construction is becoming increasingly popular.

We see that our adhesive products are increasingly used in modular buildings. The prefabricated facade components are constructed at a remote location (sometimes remotely) and then delivered to site. The complete construction of the prefabricated sections is then done on site.

Sustainable design is standard

Another important trend in all sectors, and thus also in construction, is sustainability. Increasingly stringent environmental regulations and the continuous search for efficient ways to reduce the energy and environmental footprint have a major impact on the façade constructions in which TWEHA adhesive products are used.

The diversity of layers is increasing dramatically. The cladding protects the interior layers of the structure from external influences, greatly enhancing the performance and durability of the façade construction. It goes without saying that the detailing of this façade construction requires attention, both in the design and construction phases! Improperly designed or executed detailing affects the lifespan and performance of the façade construction.
