

ALUMINUM IS THE RECYCABLE SOLUTION!

Aluminum is becoming increasingly popular in our sector. It has many advantages: it is light, flexible and versatile. It is infinitely recyclable and remains essentially unchanged, bringing sustainable, ecological and energy savings.

The recyclability of aluminum is an important factor in industry. This is due to its cost price and high energy value in its production. On top of that, it offers many advantages. During the recycling process, it consumes only a fraction (5%) of the original energy needed to produce the aluminum. Aluminum is also fully recyclable.

Recycling is essential for sustainable economic growth. Aluminum is therefore a solution to many of the social and economic challenges facing the world in its attempt to build a more sustainable and resource-efficient economy.

More than half of all aluminum produced in the European Union comes from recycled aluminum. And this trend continues to grow. And with its infinite recyclability and strong recycling infrastructure, aluminum is an essential part of the European circular economy.
