

## **BONDED CLADDING IN COLD AREAS**

Spectacular designs and durable buildings. We are proud to contribute to beautiful projects all over the world with our TWEHA solutions.

We would like to bring to your attention the Lake Road project in Ohio Cleveland (USA). Here it can get quite cold during the winter months. It is important to take this into account when bonding sheet materials.

For years, TWEHA has offered the solution for bonding at lower temperatures. Where other systems fail by using primers (which simply do not work when it gets too cold outside), TWEHA products can simply be used safely. This is because primers are not required with our products. As a result, the adhesive system can also easily be used at temperatures below 5°C.

In the case of Lake Road, we chose to collaborate with Laminam, an innovative manufacturer of large, thin, ceramic sheet materials. We glued these, without primer of course, to the facade of a series of apartment buildings in a beautiful inspiring location.
