

## **BONDING ON DIFFERENT SUBSTRATES**

A prominent trend in the adhesive market is the development of products compatible with multiple substrates. In recent decades, the composition of façade constructions has become much more complex due to the increased diversity of layers. The variety of cladding materials plays a key role in this: it protects the inner layers of the construction from the external environment, thereby enhancing or ensuring the performance and durability of the components in the façade construction.

TWEHA focuses on this area and has prioritized its research and development efforts to formulate polymers that provide durable bonding on multiple substrates applicable in the façade industry, positioning itself as the first choice for bonded façade constructions.

Check out our overview of tested and approved cladding materials.
