

THE ONLY WAY IS UP

By birth and (domestic) migration the quantity of city residents will increase eight million weekly the next thirty years. So, people have to live more densely, and we are going to use the vertical component of the city more effectively.

In comparison: The Hague, the city with the highest density in the Netherlands has 6,200 inhabitants per square kilometer. However, you will find genuine densities in Manhattan and Hong Kong with 25,000 to 60,000 inhabitants per square kilometer.

In the sixties the world counted only two or three buildings higher than 200 m, now there are already a thousand. The advantage of building in high density is not only space-saving but also energy saving. So high-rise is the answer in areas where the urban population is increasing rapidly.

Luckily, we have established that TWEHA's bonded constructions make a major contribution building higher and lighter!
