

TWEHA BLACKEN

The facade industry is innovative and challenging. The way in which we develop facade constructions is undergoing major changes. For years, we have making our contribution to innovations by coming up with smart solutions for our customers. TWEHA now also plays a leading role in this internationally.

A good example is the development of TWEHA Blacken. An application that offers our customers significant advantages in terms of production, logistics and also cost reduction.

To achieve a black appearance in the joint between the cladding panels, it is no longer necessary to anodize the aluminum profile. Simply draw a black line with the sponge on the TWEHA Blacken tube and the problem is solved. And that for a fraction of the costs of anodizing.

1 set (5 tubes 30 ml) is sufficient for 150 m¹ (500 ft.).
