

TWEHA, FOR BONDED CLADDING

When installing a ventilated façade construction, you have to be very accurate. Safety comes first, of course. You do not want your glass or natural stone panels to fall down. And what you also do not want is for your facade to deform or other imperfections.

At TWEHA we have developed an adhesive that bonds all types of facade cladding (except plastics) to a ventilating supporting structure. Not only resulting in very sleek and aesthetic, but also very sustainable. We do this in cooperation with a large group of professionals. Through an extensive network of specialists in 43 countries, we support the quality of application with our adhesive systems worldwide.

Because we are active in so many different countries and continents, we are used to a wide range of weather conditions. Extremely cold, hot, dry, humid climates... we have a solution for everything. You can find a selection of projects we are proud of at

www.tweha.com/projects.
