

WHY DOES TWEHA USE THE TERM “TESTED AND APPROVED”?

Tests are an essential part of the TWEHA concept. The bonded joint differs from a mechanical connection because the strength only takes place during the curing-, production- or application process and depends on the behavior and adhesion to the substrates to be used. Therefore, the strength must always be tested (!) and qualified beforehand.

To achieve a high-quality and durable adhesive connection, quality must be achieved by implementing suitable methods and measures. The purpose of the tests by TWEHA is to establish a quality level that, from the point of view of durability, economic and safety consequences, meet acceptable limits.

The list of tested and approved materials grows monthly. More than 250 brands/types! Recently, we tested and approved bonding PULSAR, FLOSA, FLORIM, GRANITI FIANDRE, HARDIE PANEL, TECHLAM, QUADRA, COVERLAM, GRES PANIA, BELLA CASA, KERROCK, SKANFAS, REDUCO and the natural stone types of BASALT and TIMARU BLUESTONE.

Please have a look at our survey of tested and approved cladding materials to be bonded on behalf of ventilated facades.

If you have any questions regarding the approved list, please contact our helpdesk.
